SUMMARY

Six years at a three-person studio. I wear many hats and have rarely been afforded the luxury of the word "no". If a task has to be accomplished, I figure out how to get it done, because there is little bandwidth for passing work along. I use coding agents when I write and review code, and I test what they produce before it ships. I meet with clients to turn a requirement into working software, and I can translate technical jargon into common nomenclature and vice versa.

EXPERIENCE

Full Stack Software Engineer, CKCollab Jan 2020–Present

Client work at a three-person studio: here are the projects I have worked on.

- I meet with clients to scope a problem and design the solution, then I build it. I translate the technical tradeoff into plain language, and plain language back into the requirement.

Pawborough, an online game

I have had my hands in almost every part of the application.

- Built features across accounts, the player economy, tasks, and forums in Django, PostgreSQL, and Vue. pytest and Playwright run before a release.
- When production failed, I used traces, metrics, logs, and Sentry to separate an API problem, a background job, and bad data. The fix ships through GitHub Actions.
- Used coding agents on those changes, and reviewed and tested the output before it shipped.

Truffle Shuffle, culinary bookings

- Met with the client to scope checkout, then built it in Django and Stripe: card payments, ACH, deposits, coupons, and memberships. Ingredient kits shipped through ShipStation.
- Built the admin tools operators use to change dates, guest lists, and assets, so a routine edit did not need an engineer. Draft and archived events stayed off the public site.

Tinderwealth, a wealth product

- Scoped the billing requirements with the client and built them in Stripe: saved cards, one-time charges, and subscriptions, including failed payments and cancellation.
- Saved cards stay on the Stripe customer. A declined card is rejected before it is saved.

Trailhead, laser configuration design

- Built the cart and Stripe checkout. A configuration run stays locked until it is paid for.
- Designed the EC2 workers that run those configuration jobs. The pool scales up when there is work and scales down when the queue is empty.

SKILLS

Languages: Python, JavaScript

Backend: Django, Django REST Framework, PostgreSQL, Redis, Celery, REST APIs

Frontend: Vue 3, Nuxt 3

Production: Git, Docker, GitHub Actions, AWS EC2 autoscaling, OpenTelemetry, Grafana, Prometheus, Loki, Tempo, Sentry

Quality: pytest, Vitest, Playwright

Payments: Stripe card checkout, ACH, subscriptions, and webhooks. PayPal checkout.

EDUCATION

BA in Computer Science, emphasis in Communication Studies, Gonzaga University
